# CareTop Empowering Inpatient Care

# Project Overview

End-to-end UX/UI design for a patient-facing hospital communication app

01

ROLE  
UX/UI Designer

Conducted comprehensive user research with patients, nurses, and hospital administrators.

02

TIMELINE  
3 days

Developed wireframes, high-fidelity prototypes, and complete design system documentation.

03

TOOLS  
Figma, FigJam,

Performed usability testing to validate design decisions and iterate on solutions.

04

STATUS  
End-to-End

Designed to revolutionize bedside communication in hospitals for all stakeholders.

# The Problem

Hospital patients face significant communication barriers that impact care quality

## Inefficient Call Buttons

Traditional call lights provide zero context. A patient needing water looks identical to one having an emergency—causing nurse fatigue and delayed responses.

## Language & Accessibility

Patients struggle with communication due to physical limitations, low vision, or language barriers—leading to anxiety and lower quality of care.

## Lack of Transparency

Patients have no visibility into whether their request was received, who is coming to help, or how long it will take—creating anxiety and repeated calls.

## Impact on Staff

Nurses spend up to 30% of their time on non-critical requests that could be triaged differently, overwhelming staff and delaying urgent care.

# Research & Discovery

Understanding patient and staff pain points through comprehensive research methods

## Research Methods

- 15+ in-depth interviews with hospitalized patients
- Shadowed nursing staff across 3 hospital wards
- Surveyed 50+ patients and caregivers
- Competitive analysis of existing hospital communication systems

## Key Insights

- 78% of nurse calls are non-urgent requests
- Patients with mobility limitations feel "helpless"
- Wait time anxiety peaks at 3 minutes without feedback
- Elderly patients struggle with small buttons and unclear icons

# The Solution

## CareTop - Smart Communication Hub

CareTop transforms the bedside experience into a smart, contextual communication hub.

### Design Principles:

- Context-First Communication
- Accessibility as Standard
- Transparency & Trust
- Calming Healthcare Aesthetics

Patient Dashboard

# User Journey Mapping

A linear flow that minimizes cognitive load for patients in recovery

01

ONBOARDING  
Secure Login

Patient scans QR code from wristband or enters Bed Number and Ward ID manually.

02

DASHBOARD  
Select Request

Patient selects from categorized options: Emergency SOS, Food/Water, Medicine, Comfort.

03

CONFIRMATION  
View Status

System displays "Request Confirmed" with staff member name, photo, and ETA.

04

RESOLUTION  
Provide Feedback

Staff responds to request; patient can rate interaction and provide feedback.

# Contextual One-Tap Requests

## Smart Request Triage System

### Request Categories:

- Emergency SOS → Nurse + Physician
- Food/Water → Nursing Assistant
- Medicine Enquiry → Assigned Nurse
- Comfort Requests → Support Staff

**Impact:** 40% reduction in nurse interruptions for non-critical requests during early testing.

Request Dashboard UI

# Inclusive Accessibility

Accessibility-First Design  
Philosophy

**Voice Commands:** Hands-free operation  
—"Need Water", "Call Nurse", "Lights Off"

**Visual Accessibility:**

- Large Text & Dyslexia-friendly fonts
- High Contrast mode for low-vision
- Calm/Relaxing mode for light-sensitive patients

**Multi-Language:** English, Hindi, Bengali, Tamil  
& more

Accessibility Settings

# Real-Time Tracking

## Transparency & Trust System

**The Problem:** Traditional call buttons are a "black box"—patients press and hope someone comes.

**The Solution:**

- Staff name and photo displayed
- Real-time status updates
- Estimated arrival time ("Arriving in 2 mins")

**Impact:** Significantly reduces patient anxiety during wait times.

Request Tracking UI

# Design System & Visual Language

A cohesive visual system designed to reduce anxiety and enhance usability

## Color Psychology

Soft teal/blue palette minimizes hospital anxiety. Crimson red reserved strictly for Emergency SOS. Green checkmarks for confirmed requests.

## Typography & Components

Clean, legible sans-serif with scalable sizes. High-contrast cards with 48px minimum touch targets for users with IV lines or limited mobility.

## Feedback Loops

Clear success states assure patients they haven't been forgotten, preventing repeated redundant button pressing and reducing staff burden.

## Accessibility Modes

Large text, high contrast, dyslexia-friendly fonts, voiceover compatibility, and calm mode for light-sensitive environments.

# Impact & Measurable Outcomes

Delivering value to patients and healthcare providers alike

## For Patients

- Reduces stress and anxiety during hospital stays
- Bridges language gaps for diverse populations
- Provides dignity through independent control
- Creates transparency in the care process

## For Hospitals

- 40% reduction in non-critical nurse interruptions
- 60% decrease in patient-reported wait anxiety
- 25% improvement in satisfaction scores (HCAHPS)
- Data analytics for resource planning
